

Digital Loan Application and Approval System

Business Case

Prepared by: Abdullah Derbashi

Role: Business Analyst

Version: 1.0

September 2026

1. Executive Summary

This business case proposes a simulated Digital Loan Application and Approval System that centralizes application tracking, document readiness, review ownership, decision recording, and performance reporting. The project addresses visibility and consistency issues that arise when teams use disconnected manual tracking.

2. Business Need

A controlled end-to-end workflow is needed to reduce incomplete applications, clarify ownership, make pending actions visible, and provide management with measures for volume, status, queue aging, and turnaround time.

3. Proposed Solution

- Create and submit loan applications using one structured record.
- Track document checklist status and missing-information requests.
- Assign applications to loan officers and retain workflow history.
- Record decisions and reason categories.
- Report application volume, status, aging, and turnaround time from simulated data.

4. Expected Benefits

- Improved traceability from application draft through decision.
- Clearer ownership and reduced follow-up delays.
- More consistent recording of application status and decision reasons.
- Reusable requirements, workflows, Jira artifacts, SQL analysis, Excel analysis, and Power BI reporting.

5. Scope and Limitations

- This is a portfolio case study using simulated data only.
- The project does not develop production software or connect to banking systems.
- It does not provide real credit scoring, pricing, policy, or regulatory advice.

6. Key Stakeholders

Stakeholder	Role	Key Needs	Influence
Lending Business Owner / Management	Strategic decision making	Application volumes, turnaround time, decisions, and exceptions	High
Loan Operations Team	Application intake and document follow-up	Centralized case status and ownership	High
Loan Officers	Application review and decision recording	Complete application package and decision controls	High
Lending Manager	Workload and escalation oversight	Queue aging, assignments, and service-level visibility	High

Stakeholder	Role	Key Needs	Influence
Customer Service Team	Applicant communication	Clear status and next action	Medium
Loan Applicants	Personal-loan application submission	Simple journey and timely updates	Medium
Business Analyst	Requirements and process analysis	Agreed process, requirements, and data definitions	High
Data Analyst	Reporting and performance analysis	Reliable simulated data and KPI definitions	Medium

7. Key Risks and Mitigation

ID	Risk	Impact	Mitigation Action
R-01	Simulated data may be incomplete or inconsistent.	High	Validate and clean data before analysis.
R-02	Requirements may change during the project.	Medium	Confirm scope and maintain a prioritized backlog.
R-03	Decision rules may be interpreted differently by stakeholders.	High	Document agreed reason categories and business rules.
R-04	No real bank systems or confidential data are available.	Medium	Keep the project clearly labeled as a simulated case study.

8. Recommendation

Proceed with the case-study deliverables in sequence: validate stakeholder needs, finalize the BRD, complete detailed process flows and Jira planning, prepare clean simulated data, then build the analysis and reporting outputs.
